JAPIO Class:

- 13.9 (INORGANIC CHEMISTRY--- Other)
- 43.4 (ELECTRIC POWER--- Applications)

Abstract:

PURPOSE: To obtain the subject full color element having enlarged selection width of organic coloring matter and high luminance at low-voltage drive free from concentration quenching, comprising a mixture of an organic luminescent material and an organic electron transfer material as a component of a thin film layer of organic luminescent material.

CONSTITUTION: An thin film layer of an organic luminescent material comprising a mixture of an organic electron transfer material and an organic luminescent material is arranged between a pair of electrodes wherein at least one is transparent to give the objective element. The element, for example, is obtained by forming an ITO transparent electrode 12 on a glass substrate 11, depositing both 2, 3, 6, 7-tetrahydro-oxo-1H, 5H, 11H-(1)benzopyrano(6,7,8,ij)-quinolizine-10- carboxylic acid of organic luminescent material and 1,1-bis-(4-N,N- ditolylaminophenyl)cyclohexane of organic electron transfer material in vacuum to form a thin film layer 14 of organic luminescent material and finally metallizing In on the thin film layer by electron beam metallizing method to form a back metal electrode 15.
